Video Copilot Install Utility 1.0 - User Guide [Mac]

The Video Copilot Install Utility is a command line tool to help you manage installed Video Copilot plugins.

1. **Plugin Licensing**
   a. **Online License Installation**

To download and install plugin licenses use the following command:

```
./vcinstallutil license install <EMAIL> <PASSWORD> <PLUGINS…>
```

Replace <EMAIL> and <PASSWORD> with your Video Copilot download account information.

<PLUGINS…> can be replaced with one or more of the following commands:

COMMAND	PLUGIN
elementv2	Element V2
opticalflares	Optical Flares
heatdistortion	Heat Distortion

Example:
```
./vcinstallutil license install email@email.com password elementv2 opticalflares
```

This will install the licenses for Element V2 and Optical Flares.

If a license is already installed you can force a re-installation by specifying the -f flag

Example:
```
./vcinstallutil license install -f email@email.com password1234 elementv2
```

   b. **Offline License Request/Installation**

To generate a license request files to the current working directory use the following command:

```
./vcinstallutil license request generate <PLUGINS…>
```

Upload the license request to the VideoCopilot website:
https://www.videocopilot.net/account/downloads/

To install a generated license use the following command:

```
./vcinstallutil license request install <PLUGIN> <LICENSE_FILE>
```

Generate example:
```
./vcinstallutil license request generate elementv2 opticalflares
```

Two files will be generated: `elementv2_request.req` and `opticalflares_request.req`.

Install example:
```
./vcinstallutil license request install elementv2 ElementLicense.license
```

You can specify the full path to the license file if it isn't located in the same directory as the install utility.

Example:
```
./vcinstallutil license request install elementv2 ~/Downloads/ElementLicense.license
```

c. License Status

To view the status of the plugins licensing run the following command:

```
./vcinstallutil license status
```

2. Element V2
a. Asset Path Management

To change the path of your Element V2 assets use the following command:

```
./vcinstallutil elementv2 setassetspath <PATHTYPE>
```

<PATHTYPE> can be one of the following commands:

COMMAND	DESCRIPTION
`user`	Current User Documents (e.g. /Users/<user>/Documents)
`shared`	Shared Documents (e.g. /Users/Shared/Documents)
`custom <CUSTOMPATH>`	A user defined path, replace <CUSTOMPATH> with the path

NOTE: No assets will be installed or moved by this command, you will have to either install them via the installer or move them manually.

Examples:
Set the assets path to the current user documents folder:
```
./vcinstallutil elementv2 setassetspath user
```

Set the assets path to a folder on a different drive:
```
./vcinstallutil elementv2 setassetspath custom /Volumes/ExternalDrive/Folder
```

If your custom path has spaces in it add quotes (" ") around your path:
```
./vcinstallutil elementv2 setassetspath custom "/Volumes/ExternalDrive/My Folder"
```

NOTE: The custom path must exist prior to calling the custom path command.
